Lab: Variant records and abstract syntax trees
CSC 312, “Programming language implementation”
Department of Computer Science · Grinnell College
September 7, 2015

Today’s pair-programming partnerships are:

• Ms. DeWitt and Ms. Jervis
• Ms. Byrne and Ms. Kyaruzi
• Ms. Liddell and Mr. Dewey
• Mr. Mulhall and Mr. Boateng Assante
• Mr. Nordin and Mr. Schlager
• Mr. Champagne and Mr. Mataire

In each pair, the partner listed first should log in and manage the keyboard and screen.

Exercises

A. Implement the data type of environments, as in section 2.2.2, using the eopl language’s define-datatype-expressions and cases-expressions. Then extend the interface and the implementation to include a new predicate, has-binding?, that determines whether a given identifier is bound in a given environment. (This is Exercise 2.21 from the textbook, page 50.)

B. Draw an abstract syntax tree, similar to Figure 2.2 on page 52 of the Friedman and Wand book, for the lambda-calculus expressions

\[((\lambda (a) (c (a b))) c)\]

and

\[(\lambda (x) (\lambda (y) ((\lambda (x) (x y)) (y x))))\]
